

Name: \_\_\_\_\_

Date: \_\_\_\_\_

## 5.3 Solving Systems of Linear Equations By Elimination

Essential Question: \_\_\_\_\_

Step 1: \_\_\_\_\_, if necessary, one or both equations by a constant so that at least one pair of like terms has the \_\_\_\_\_ or \_\_\_\_\_ coefficients.

Step 2: \_\_\_\_\_ or \_\_\_\_\_ the equations to eliminate one of the \_\_\_\_\_.

Step 3: \_\_\_\_\_ the resulting \_\_\_\_\_.

Step 4: \_\_\_\_\_ the value from Step 3 into one of the \_\_\_\_\_ equations to \_\_\_\_\_ for the other variable.

### EXAMPLE 1

#### Solving a System of Linear Equations by Elimination

Solve the system of linear equations by elimination.

$$3x + 2y = 4 \quad \text{Equation 1}$$

$$3x - 2y = -4 \quad \text{Equation 2}$$

### EXAMPLE 2

#### Solving a System of Linear Equations by Elimination

Solve the system of linear equations by elimination.

$$-10x + 3y = 1 \quad \text{Equation 1}$$

$$-5x - 6y = 23 \quad \text{Equation 2}$$

Example 2b

$$5x + 8y = 1$$

$$-2x + 2 = 3y$$

## Solving Real-Life Problems

### **EXAMPLE 3** Modeling with Mathematics

A business with two locations buys seven large delivery vans and five small delivery vans. Location A receives five large vans and two small vans for a total cost of \$235,000. Location B receives two large vans and three small vans for a total cost of \$160,000. What is the cost of each type of van?
